Data presented are from Ph.D. holders at U.S. universities. Overall response rate by society ranged from 5% (chemistry) to 22% (social science), although these figures include additional non-selected respondents who may not have held a Ph.D., worked at a university, or been based in the United States.

Between three and five waves of data collection were used for each society (i.e., an initial invitation followed by additional reminders). Initial analyses were done to see if there were differences between response waves for demographic, behavioral, and attitudinal questions. No consistent pattern of differences were found, suggesting that respondents who responded to the initial wave were similar to those who responded to later waves.

Overall, it is clear that scientists surveyed (p. 2) are relatively more male, and white compared to the U.S. population which, according census.gov, is approximately 51% female and 77% white (<https://www.census.gov/quickfacts/table/PST045215/00>).

Notes: Respondents selected between "Never" (1) and "Everyday" (8) for all questions

Respondents used traditional media (including online versions) more often than newer, online channels of information (p. 3). Members of the social science societies surveyed were the most frequent users of all media types, often by substantial margins.

Notes: Respondents were asked to select all the applicable funding sources from the most recent five years.

Respondents received funding from a range of sources with substantial variation by society (p. 4).

Table: Descriptive statistics and frequency for ideology

	M	SD	N	Very conservative	Conservative	Somewhat conservative	Moderate	Somewhat liberal	Liberal	Very liberal
General	5.62	1.22	1081	0%	2%	4%	11%	17%	42%	23%
Biological	5.23	1.45	668	1%	7%	5%	15%	15%	42%	15%
Geophysical	5.55	1.23	883	1%	2%	4%	12%	19%	41%	21%
Geological	5.31	1.32	724	1%	4%	4%	16%	20%	39%	16%
Ecological	5.83	1.08	343	0%	1%	1%	10%	15%	45%	27%
Chemistry	4.86	1.56	478	3%	8%	8%	17%	20%	33%	11%
Biochemistry	5.36	1.26	363	0%	2%	7%	14%	21%	39%	17%
Social Science	5.63	1.31	909	0%	3%	4%	13%	16%	37%	28%

Notes: Respondents were asked how they would describe their political views on a five-point scale from "very conservative" (1) to "very liberal" (5).

Respondents from all societies surveyed were much more likely to report being liberal than conservative (p. 5). The chemistry society members surveyed were the least likely to report being politically liberal; this pattern did not extend to the biochemistry group.

Notes: For past engagement, respondents were asked "about how often they have participated in" various forms "of engagement within the last year." Response options were "never" (0), "less than once a month" (1), "once a month" (2), "2-3 times a month" (3), "once a week" (4), "2-3 times a week" (5), and "daily" (6). For willingness, respondents were asked "Looking forward, how willing would you be to take part in the following types of engagement or outreach in the next 12 months? Select the point between the two labels that best describes your level of willingness or unwillingness." Respondents were asked to answer using a 7-point scale anchored by "not at all willing" (1) and "very willing" (7) with "neutral" as the middle (4) option.

Face-to-face engagement was generally the most commonly performed type of past engagement and the type of engagement for which respondents generally indicated the highest level of willingness (p. 6). Willingness, however, was quite high across most forms of engagement with the notable exception that there was less overall willingness for online engagement.

Across societies, social scientists and ecologists were often the most likely to have engaged and express high levels of willingness.

Table: Beliefs about engagement and motives for engagement

	Motivation: I became a scientist to work for the public good			Motivation: I am currently trying to make a positive impact on the world through my science			Attitudes: Unenjoyable/Enjoyable			Attitudes: Unpleasant/Pleasant			Attitudes about engagement scale (average of 'enjoyable and 'pleasant,' $r = .83$)

Notes: Motivation questions and audience questions used saw respondents select between "strongly disagree" (1) and "strongly agree".

For the questions reported here and on subsequent pages where data is presented in a similar format, respondents were randomly assigned to answer questions only in the context of a single 'mode' of engagement, whether face-to-face, mediated, or online. This means that the sample size for each mode is somewhat lower than the overall sample size. This needs to be taken into account when considering margin of sampling error.

For motivation (p. 7), on average, respondents said they became a scientist to work for the public good and that they were trying to make a positive impact on the world through their science.

For attitudes toward engagement, respondents were generally more likely to say they saw engagement as likely to be enjoyable and pleasant. However, scores were typically lower for mediated engagement when compared to face-to-face engagement, and lower still for online engagement.

For attitudes toward the audience (p. 8), respondents indicated that they expected that the people with whom they would likely interact would generally treat them with respect and would listen to what they had to say. Again, however, these perceptions were sequentially lower for respondents who were asked about engaging via the news media or online, in comparison to those asked about face-to-face engagement.

Differences between societies were generally small.

Table: Beliefs about norms

Notes: Respondents selected between "strongly disagree" (1) and "strongly agree" (7) for all questions

For norms (p. 9), scientists had a mix of views (i.e., mean was toward the mid-point of the scale) with regard to the degree to which they thought their colleagues were engaging (i.e., perceived descriptive norms). There was only limited variation between societies and engagement modes.

In general, respondents across modes and societies also indicated that they thought their colleagues would have generally positive reactions to those who engaged (i.e., injunctive norms).

For efficacy (pp. 10), responding scientists varied in the degree to which they said they had the skill to engage effectively, especially those who were asked about engagement with the news media or online engagement (i.e., internal efficacy). There were few substantive differences by society.

Respondents, however, indicated that they generally thought that engagement had the potential to have an impact on society (i.e., external efficacy). Face-to-face, and engagement through the news media was generally seen in a more positive way than online engagement but online engagement still received scores well above the scale mid-point. There was again only limited variation by society.

For time (p. 11), respondents varied in the degree to which they said that they time for engagement and many indicated that they wished they had more time.

Table: Societal goals for public engagement

	Societal Goal: Getting policy makers to use scientific evidence			Societal Goal: Helping ensure our culture values science			Societal Goal: Helping people use science to make better personal decisions			Societal Goal: Obtaining adequate funding for scientific research			Societal Goal: Getting more young people to choose scientific careers			Societal Goal: Helping to diversify the STEM workforce

Notes: Respondents selected between "strongly disagree" (1) and "strongly agree" (7) for all questions.

There was almost universal endorsement of the goals of getting policy makers to use evidence and ensuring our culture values science. (p. 12) High means for the goal of getting people to make better personal decisions, and ensure adequate funds for science also indicates large proportions of the scientists surveyed endorsed these goals.

Recruitment goals rated the lowest of the societal goals but were still seen as important, relative to the mid-point of the seven-point scale.

For personal goals (p. 14), a desire to increase the impact of one's research and fulfilling a sense of duty to society, (both of which might also be considered a societal goal) were seen as similar in importance to many of the societal goals.

Enjoyment was rated as similar to recruitment whereas the goals of trying to obtain research funding and networking were rated somewhat less positively, near the mid-point of the scale.

For objectives (pp. 15-16), scientists indicated that the outcomes they would most prioritize were the relatively traditional objectives of helping to inform people about scientific issues and getting people excited. Defending science from those who spread falsehood and showing that the community cares about society were also prioritized relatively frequently.

Objectives associated with demonstrating openness, showing that scientists share community values, and framing were consistently the next most common set of objectives. These were followed by hearing from others and showing expertise. The final two objectives, it should be noted, were the only two objectives that consistently averaged less than about a 5 on the 7-point scale provided to respondents.

Another notable pattern is that the social scientists surveyed frequently had the lowest prioritization of objectives, although this might reflect a tendency not to choose high scores for all objectives. The social scientists also, however, selected objectives such as showing expertise more frequently than other respondents.

Table: Personal goals for public engagement

	Personal Goal: Increasing the impact of research			Personal Goal: Fulfilling a sense of duty to society			Personal Goal: Personal enjoyment			Personal Goal: Obtaining research funding			Personal Goal: Meeting other scientists

Notes: Respondents selected between "Very low important" (1) and "Very high importance" (7) for all questions.

For ethicality (pp. 18-19), very high means (around 6 on a 7-point scale) suggest that the scientists surveyed had few concerns about the ethicality of the objectives associated with helping to inform people about science, defending science, or exciting people about science. The ethicality of demonstrating openness, showing caring, and hearing what others think are nearly as high.

There are minor drops for ethicality for the objective of hearing from others, showing that scientists care and showing expertise. The ethicality for framing was consistently the lowest, although the mean is still well above the scale mid-point for almost all of the societies.

There do not appear to be substantive or consistent differences by mode (i.e., perceived ethicality of objectives were similar whether the respondent was asked about face-to-face, news mediated, or online engagement). The society of the respondent seems similarly unimportant.

For injunctive norms, (pp., 20-21), informing, exciting and defending are all similarly high across survey mode and society. Responding scientists were, on average, a little less sure their colleagues would look well on other scientists who sought to demonstrate expertise, caring and openness. Framing, showing values, and hearing from others were lower still, though still above the scale midpoint, in most cases.

While respondents from most of the societies seem to provide similar responses, the social science society gave somewhat lower ratings for many of the non-information-related objectives.

For descriptive norms (pp. 22-23), the scientists surveyed indicated that they thought their colleagues most often focused on defending, informing, and exciting. Showing expertise, caring, and openness were seen as somewhat less common. The least common objectives that scientists from across the different types of societies saw were showing community values and listening to others.

For external efficacy (pp. 24-25), the respondents appeared to have a lot of belief in the likely impact of almost all the potential objectives about which they were asked. Exciting and informing people ranked highest, in most cases, followed by very similar scores for the rest of the objectives.

There was little variation by engagement mode or society, although the social scientist society members who participated appear to have been a little more skeptical about the value of hearing from others, and showing that scientists share community values.

For internal efficacy (pp. 26-27), respondents appeared to believe they had the most skill at informing and exciting and the least skill at framing and showing they share community values. There was limited variation by society and by model, although the social scientists appeared to believe they had someone higher in some places.

Finally, scientists also indicated they had thought most about exciting, informing and defending (pp. 28-29). The other objectives were relatively less likely to have been considered, regardless of mode or society. Further, given that the means for often at the mid-point for the scale, this suggests that about half of those surveyed had given relatively limited thought to most of the objectives about which they were asked prior to taking the survey.

Information about ethicality, normative, and efficacy beliefs are also provided by objective (pp. 30-38).

Table: Beliefs about ethicality of objectives

	Ethicality: Helping to inform people about scientific issues			Ethicality: Defending science from those who spread falsehoods			Ethicality: Getting people interested or excited about science			Ethicality: Demonstrating the scientific community's openness ...			Ethicality: Showing that the scientific community cares about society's well-being
